NOTE: FLUE GAS TEMPERATURES MUST NOT EXCEED 650°F AT VENT SYSTEM INLET.

WARNING

THESE INSTRUCTIONS ARE INTENDED AS AN AID TO QUALIFIED, LICENSED SERVICE PERSONNEL FOR PROPER INSTALLATION, ADJUSTMENT AND OPERATION OF THIS UNIT. READ THESE INSTRUCTIONS THOROUGHLY BEFORE ATTEMPTING INSTALLATION OR OPERATION. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN IMPROPER INSTALLATION, ADJUSTMENT, SERVICE OR MAINTENANCE POSSIBLY RESULTING IN FIRE, ELECTRICAL SHOCK, CARBON MONOXIDE POISONING, EXPLOSION, OR PERSONAL INJURY OR PROPERTY DAMAGE.

MODEL SS1

SideShot® is a registered trademark of Tjernlund Products, Inc. for their Models SS1 & SS2 Vent Systems.

DESCRIPTION

The SS1 is a mechanical vent system designed and listed for use with natural draft oil or gas heating equipment. It is factory assembled and wired. The SS1 automatically vents the flue gases from heating equipment to the outdoors. By combining outside air with high-tech insulation, surrounding combustible materials and the Vent Hood exterior remain at safe temperatures. After each burner cycle the SS1 will continue to operate in post-purge mode to purge the heater and vent of residual flue gases. A factory post-purge time is set at 2 minutes and is adjustable up 16 minutes, see “Pre / Post-purge Settings” on page 5. The SS1 features a safety system consisting of the integral UC1 Universal Control, a Fan Proving Switch and a High Limit temperature control. These devices monitor the SS1’s performance and will interrupt the main burner if a venting malfunction is detected.

APPLICATION TABLE

Verify that the total BTU/hr. input of the heating appliance(s) fall within the proper category listed below. All BTU/hr. capacity ranges are based on a maximum of 50 equivalent feet. To determine equivalent feet, add the total length of straight vent pipe plus 10 feet for each 90 degree elbow and 5 feet for each 45 degree elbow. Vent runs of over 15 linear feet should use an approved, insulated vent connector to prevent problems related to sulfur condensation.

SPECIFICATIONS

Motor: 115/1/60, 3300 RPM, 212 watts, 2.28 FLA

Fan Proving Switch: Non-adjustable, N/O with a set point of -.04" W.C.

High Limit: Manual reset, N/C contacts, open at 79°C (175°F) ± 8°C (15°F)

UC1 Universal Control: See UC1 Universal Control Board Features on page 4.

Pre-Purge: Options (0, 15, 30, 60 seconds); Post-Purge: Factory set at 2 minutes, Options (0, 30 seconds or 1, 2, 4, 8, 16 minutes). See Page 5 for Pre / Post-purge options.

GENERAL INFORMATION

These units have been factory tested and rated in accordance with the following Canadian Standards: CAN/CSA - B140.0-M87 General Requirements For Oil Burning Equipment; CAN/CSA - B139-M91 Installation Code For Oil Burning Equipment; CAN3 - B255-M81 Mechanical Flue - Gas Exhausters.

Each SideShot is electrically factory line tested before shipment.

After opening carton, inspect thoroughly for hidden damage. Wheel should rotate freely. If any damage is found notify freight carrier and your distributor immediately and file a concealed damage claim.

INSTALLATION RESTRICTIONS

1. The SideShot may not be installed on condensing appliances, incinerators, incinerating toilets, or solid fuel burning appliances.

2. The SideShot Model SS1C is Listed for Oil Fired appliances only.

3. The SideShot may only be installed on appliances equipped with a barometric draft control.

4. The SideShot shall not be installed where flue gas temperatures exceed 301°C (575°F) at its inlet. Flue gas temperature verification:

   A) On oil fuel, verify flue gas temperature at SS1C inlet is at or above 250°F (121°C) after 5 minutes of operation during setup. See “Oil Draft Adjustment Procedure” on page 17, step 10.

   AND

   B) Measure temperature of flue gases at the inlet to the SideShot at time of installation. Temperature should be measured after appliance and SideShot have operated for at least 15 minutes, allowing flue gas temperature to stabilize.

5. The maximum recommended wall thickness is 39cm (15”).

6. Vent runs of over 4.5 linear meters (15 linear feet) should use an approved, insulated vent connector to prevent problems related to sulfur condensation.

CAUTIONS

⚠️ WARNING

Improper installation, adjustment, alterations, service or maintenance can cause injury, property damage or death. Refer to this manual. For assistance or additional information consult a qualified installer, service agency or the equipment supplier.

Do not exceed the recommended input range of the SideShot. Under no circumstances shall the minimum draft adjustment be used for the larger input range of this product. Improper adjustment may result in the dispersion of flue products (carbon monoxide) into the building interior causing carbon monoxide poisoning or death.

If oil nozzle is changed or other equipment is added perform “Draft Adjustment Procedure” on pages 16, 17 again.
**CAUTIONS**

**WARNING**

The SS1 must be installed by a qualified installer (an individual properly licensed and/or trained) in accordance with all local codes or, in their absence, in accordance with the appropriate National Fire Protection Association #31, #54, #211 and the National Electrical Code.

Failure to install, maintain and/or operate the SS1 in accordance with manufacturer's instructions may result in conditions which can produce bodily injury and property damage.

1. The installer must verify that the BTU/hr. input of the appliance does not exceed the recommended input of the SS1. See “Application Table” on page 1 of these instructions for maximum input capacities.
2. Disconnect power supply from the SS1 and heating equipment when making wiring connections and servicing the SS1. Failure to do so may result in personal injury and/or equipment damage. LED #5 (RED) should be off with power removed.
3. Plan the vent layout so that the code required clearances are maintained from plumbing, wiring and combustible materials.
4. The SideShot motor shaft must be mounted horizontally to ensure proper operation of the Fan Proving Switch and prevent motor bearing wear.
5. Flue gas temperatures must not exceed 650°F at SideShot inlet. Ambient temperature must not exceed 104°F.
6. Oil fuel, flue gas temperature at vent system inlet must be at least 250°F during appliance steady state.
7. Make certain power source is adequate for the SideShot requirements. Do not add the SideShot to a circuit when the total electrical load is unknown.
8. "Safety Inspection of a Previously Used Appliance", below must be completed when replacing a conventional chimney venting system or when SideShot is installed on used heating equipment.

**SAFETY INSPECTION OF A PREVIOUSLY USED APPLIANCE**

(Perform prior to SideShot installation)

The following procedure is intended as a guide to aid in determining that an appliance is properly installed and is in safe condition for continuing use. This procedure is based on central furnace and boiler installations and it should be recognized that generalized procedures cannot anticipate all situations. Accordingly, in some cases deviation from this procedure may be necessary to determine safe operation of the equipment.

a. This procedure should be performed prior to any attempt at modifications of the appliance or installation of the SS1.

b. If it is determined there is a condition which could result in an unsafe operation, the appliance should be shut off and the owner advised of the unsafe condition.

The following steps should be followed in making the safety inspection:

1. Visually inspect the venting system and determine there is no blockage or restriction, leakage, corrosion or other deficiencies which could cause an unsafe condition.
2a. Oil Installations: Inspect burner and primary control for proper operation.
2b. Gas Installations: Conduct a gas leakage test of the appliance piping and control system downstream of the shutoff valve in the supply line to the appliance. Inspect burners and cross overs for blockage and corrosion.
3. Applicable only to furnaces: Inspect heat exchanger for cracks, openings or excessive corrosion. Check both the limit control and fan control for proper operation.
4. Applicable only to boilers: Inspect for evidence of water or combustion product leaks. Determine that the water pumps are in operating condition. Test low water cutoffs, automatic feed controls, pressure and temperature limit controls and relief valves in accordance with the manufacturer's recommendations to determine that they are in operating order.

*Excerpts from the National Fuel Gas Code (ANSI Z223.1/NFPA #54), Appendix H.

**SIDESHOT® MODEL SS1 TERMINOLOGY**

[Diagram of SideShot SS1 model with labeled components]
SS1 WITH INTEGRAL UC1 UNIVERSAL CONTROL BOARD FEATURES

P1 - P2 SAFETY CIRCUIT TERMINALS
1 mA @ 5VDC.
SEE WARNING # 1.

DIP SWITCH SETTINGS
Pre-Purge (1-2)  
Post-Purge (3-8)  
Prover status check (9)  
See “Pre / Post Purge & Prover Status Check Dip Switch Settings”.

LED STATUS LIGHTS
See “LED Status & Fault Indicator Section” for details.

APPLIANCE CALL VOLTAGE SELECTION

IMPORTANT
Place RED voltage jumper in proper location based on appliance call interlock voltage.  SEE WARNING # 2.

J1 - J2 CALL JUMPER
Used when the call signal is used as the “proven” return signal to the appliance.  See wiring section for details.

APPLIANCE INTERLOCK TERMINAL BLOCK (A-B, 1-4)
A - B - Dry Contact call.  3 mA @ 5VDC.  
SEE WARNING # 1.
1 - 24 or 115 VAC intercepted call.  
IMPORTANT: RED voltage jumper must match intercepted call voltage.
2 - 24V common or 115V Neutral.  
3 - Common terminal to appliance relay contacts.  IMPORTANT: J1-J2 jumper routes call voltage at terminal 1 to 3.  Remove J1-J2 jumper if a different voltage source is provided to terminal 3.
4 - Normally open terminal of appliance relay.  Will be energized from terminal 3 if safety circuit is “proven”.

L / N - 115 VAC POWER SUPPLY BLOCK
115 VAC / 50-60 Hz
Circuit protection provided by installer.  
SEE WARNING # 3.

C, GND, F AUXILIARY DEVICE COMMUNICATION TERMINALS
2 mA @ 5VDC.  For Tjernlund MAC1E or MAC4E auxiliary devices.  SEE WARNING # 1.

APPLIANCE INTERLOCK RELAY
1 HP MAX LOAD across terminals 3 & 4.

VENTER MOTOR RELAY
1 HP MAX LOAD from terminals L to MTR & M.

XL / XN AUXILIARY DEVICE POWER TERMINALS
115 VAC - Maximum of 0.15 Amps.  
Only connect to Tjernlund auxiliary devices.  
SEE WARNING # 1.

MTR & M LOAD TERMINALS FROM VENTER MOTOR RELAY
Used to drive SS1 Motor.  
1 HP MAX LOAD across terminals MTR & M / N.

XL / XN AUXILIARY DEVICE COMMUNICATION TERMINALS
2 mA @ 5VDC.  
For Tjernlund MAC1E or MAC4E auxiliary devices.  
SEE WARNING # 1.

APPLIANCE INTERLOCK RELAY
1 HP MAX LOAD across terminals 3 & 4.

VENTER MOTOR RELAY
1 HP MAX LOAD from terminals L to MTR & M.

XL / XN AUXILIARY DEVICE POWER TERMINALS
115 VAC - Maximum of 0.15 Amps.  
Only connect to Tjernlund auxiliary devices.  
SEE WARNING # 1.

MTR & M LOAD TERMINALS FROM VENTER MOTOR RELAY
Used to drive SS1 Motor.  
1 HP MAX LOAD across terminals MTR & M / N.

DIP SWITCH SETTINGS
Pre-Purge (1-2)  
Post-Purge (3-8)  
Prover status check (9)  
See “Pre / Post Purge & Prover Status Check Dip Switch Settings”.

WARNING

# 1.  Power supplied by board.  Do not supply power to this area or control damage may result.
# 2.  Do not supply power to the appliance interlock block with the call selector in the “DRY” position.  
Control damage may result if power is supplied.
# 3.  Circuit protection must be provided by the installer.  16 Amps is the maximum current allowed for this device at terminal L.  
A 15 Amp circuit breaker is recommended.

LED INDICATOR LIGHTS
LED #1 (Amber)  Appliance call for heat.
LED #2 (Green)  Safety circuit through P1 & P2 (SS1 Limit & Fan Prover) is verified “Open” upon start-up.  Burner circuit is energized with contact closure from terminal 3 to 4.  Also verifies SS1 prover & limit are closed during run cycle.
LED #3 (Green)  Power switched to SS1 Motor from L to MTR & M.
LED #4 (Red)  Status indicator.
LED #5 (Red)  115 VAC power supplied to board.  Also used as status indicator.

LED INDICATOR LIGHT STATUS & FAULTS
LED #4 & #5 Flashing Alternately  = Prover start up fault.  SS1 Prover contacts “Closed” across P1 & P2 upon appliance call before SS1 is turned on.  Prover status check must be activated, see page 5.
LED #4 & #5 Flashing in Unison  = Fan Prover circuit is “Open” longer than 60 seconds on start-up or 10 seconds during run cycle.  Prover or Limit contacts are not staying “Closed” across P1 & P2 safety circuit.
LED #4 Flashing & #5 on Continuous  = System in Pre-Purge.  (Pre-Purge options 0, 15, 30, 60 seconds)
LED #5 Flashing & #4 on Continuous  = System in Post-Purge.  (Post-Purge options 0, 30 seconds or 1, 2, 4, 8, 16 minutes)
IMPORTANT: To reset faults, verify fault by checking the LEDs and then remove call for heat.
Remove power to SS1 and heating equipment when installing, servicing or changing dip switch settings. Failure to do so may result in personal injury and/or equipment damage. LED #5 (RED) should not be on if 115 VAC supply power is removed from the control.

**Pre-purge**
Used for a Venter with longer vent runs to get draft fully established throughout the vent system prior to burner ignition. Also beneficial for negative pressure prone environments. **IMPORTANT:** Pre-purge settings must be shorter than primary control lockout time unless wired prior to primary control (i.e. aquastat / thermostat).

**Post-purge**
A Venter post-purge has been factory set at 2 minutes. Confirm that dip switch #5 is in the up or "on" position. Oil fired equipment requires that the post-purge be long enough to eliminate post cycle nozzle drip odor. A longer post-purge may be necessary for longer vent runs or high heat retention, refractory lined combustion chambers. A shorter post-purge may be desired for gas installations.

**P1 & P2 FAN PROVER SAFETY CIRCUIT “OPEN” UPON APPLIANCE CALL**

The Prover Status Check is activated from the factory. When activated the UC1 Universal Control checks across P1 & P2 safety circuit (SS1 Prover & Limit) to verify that the Fan Prover switch is “Open” upon a call for heat and not stuck “Closed”. **IMPORTANT:** This must always be in the down “Activated” position when side wall venting.
With an inlet flue gas temperature of 650°F or below, the SideShot has been Listed for the following clearances from combustible materials:

**IMPORTANT**
Vent Hood and top of Plenum: Zero Clearance
Plenum front and sides: 1/2 inch
Plenum rear: 3 inches

**VENT HOOD TERMINATION CLEARANCES**

The SideShot has been ETL Listed according to the requirements of the National Fire Protection Association #31, #54 and #211 as follows, (See Diagram A).

- The exit terminals of mechanical draft systems shall not be less than 7 feet above grade when located adjacent to public walkways.
- A venting system shall terminate at least 3 feet above any forced air inlet located within 10 feet.
- The venting system shall terminate at least 4 feet below, 4 feet horizontally from or 1 foot above any door, window or gravity air inlet into any building.
- The bottom of the vent terminal shall be located at least 12 inches above grade.
- The exit terminal shall be so arranged that the flue gases are not directed so as to jeopardize people, overheat combustible structures or enter buildings.
- Not to be less than 10 feet from an adjacent building.

The SideShot is also Listed to terminate a minimum of 12" below, above or horizontally from a soffit, deck or adjacent sidewall.

If possible, do not terminate the SS1 on a wall that faces the direction of the prevailing winds. Backdrafts by severe winds can cause oil odors to remain in the structure and/or interrupt heating equipment operation.
INSTALLATION

Tools required:

- Reciprocating Saw
- Drill and 1/8", 1/4", 1/2" Bits
- Blade Screwdriver
- Wire Cutter/Stripper
- Tube Cutter
- 1/2", 7/16", 5/8" Wrench
- 1/4" Masonry Drill Bit
- 1/4", 5/16", 11/32" Nut Runner or Socket
- Hammer

INSTALLING VENT HOOD TERMINUS

1. a) Fold template A (Page 25) along dashed line and attach in between the floor joists ensuring that it is snug against the sill plate and right hand floor joist. Follow same procedure if floor trusses are used, (See Diagram B).

b) If the SideShot is not being installed between floor joists, attach the template to the wall it will be exiting ensuring it is level.

2. Using 1/2" bit, drill pilot holes noted on each side of the template from inside through rim-joist, wall board, siding, etc., keeping drill bit perpendicular to the wall. 1/2" bit must be long enough to penetrate through exterior.

3. Remove template from rim-joist and attach to building exterior, aligning pilot hole markings on template with holes previously created in Step #2.

4. Drill the four corner holes noted on the template through the building exterior. Remove the template and mark lines from the outside edge of the holes drilled, forming a rectangle.

5. Using reciprocating saw and appropriate blade, cut a rectangular opening through the rim joist, wall board, siding, etc., on the lines marked in step 4. The rectangular opening should be no larger than 8-3/8" in width by 8" in height, (See Diagram C).

6. Knock out block material exposing rectangular opening through the wall.

7. Apply two beads of exterior rated caulk approximately 3/8" in width at the seam of the outermost casing of the Vent Hood and the inner flange of the Vent Hood Terminus, (See Diagram D).

8. Slide the Vent Hood through the wall while taking care installing the rain shield as shown, (See Diagram E). The nuts located on the Vent Hood outermost casing should be facing up when sliding it through the wall. Mount Vent Hood to the exterior using four #8 x 3" wood screws and spacers provided, (See Diagram E). Wall anchors are provided for installation into masonry wall.
9. Connect the Plenum to the Vent Hood of the SideShot following the steps on pages 8, 9 and 10.

10. After the SideShot is completely installed, apply a bead of exterior rated caulk between the Vent Hood Terminus inner flange and the exterior of the building, (See Diagram F).

### INSTALLING PLENUM

Depending on building construction, it may be necessary to notch out a section of the floor joist to provide proper clearance for the SideShot motor.

1. Attach Template B (Page 24) to the floor joist that is to be notched, aligning the sight line noted on the template with the end or the outside casing of the vent hood.

2. Cut out notch on line shown on the template.
It is recommended and local codes may dictate that the joist be reinforced as outlined below. Bracing of the rim joist is not necessary.

1. Cut two 2 x 4 pieces of wood 28 inches in length.

2. Center both pieces on each side of the floor joist above the notch and drive 8 16D or larger nails into each piece, (See Diag. H)

![Diagram H](image)

**CONNECTING THE PLENUM TO THE VENT HOOD**

NOTE: Cut any nails which are protruding downward from the subfloor that may come in contact with the SideShot. Place both slip joint drivers in your pocket before continuing.

**WARNING**

Minimum clearances from the Plenum to any combustible materials must be maintained as listed on page 6.

NOTE: Blower - Motor/Wheel assembly can be removed to make Plenum section lighter & easier to install. Refer to Removal and Replacement of Motor/Wheel Assembly, Page 22.

1. Connect the Plenum to the Vent Hood by aligning both grooves on the bottom of Plenum with both grooves on the bottom of the Vent Hood. The Plenum is designed to slide into the Vent Hood, (See Diagram I).

2. Gently slide the Plenum into the Vent Hood until the slip joint guides located on each side of the Plenum are in contact with each other.

3. Slide the slip joint drivers from the bottom upward over the the slip joint guides as far as possible by hand. A hammer may be used to tap the slip joint drivers to their final position. Start the slip joint drivers on the slip joint guides with the embossed end facing down. Do not force slip joint drivers past embossing.

![Diagram I](image)

**INSTALLATION OF WALL SUPPORT BRACKET**

1. To prevent damage to the SideShot, temporarily support the bottom of the plenum (prop on ladder top) while assembling the wall support bracket. Assemble the wall support bracket as shown, (See Diagram J).

2. Using the prepunched holes, adjust the wall support bracket so that a slight pitch is maintained for water drainage, (See Diagram J).

3. Use the prepunched holes on the wall bracket as a template to mark holes to be drilled into the side wall for mounting screws.

4. a) If installing the bracket into a wood wall, drill 2 pilot holes at each point established in step 3 with a 1/8" drill bit approximately 1" deep and install the screws provided to secure the bracket to the wall.

   b) If installing the bracket into a masonry wall, drill 2 holes at each point established in step 3 with a 1/4" masonry drill bit approximately 1" deep. Tap the masonry anchors into the holes drilled in step 4. Screw the wall bracket onto the wall.

5. Connect the other end of wall support bracket to the stud on the plenum using the supplied 1/4"-20 keps nut. (See Diagram J).
INSTALLATION OF VENT PIPE

If installing the SideShot Vent System on an oil or gas appliance which is not equipped with a draft hood or draft diverter, a barometric draft control must be used. Install the barometric draft control as shown, (See Diagram K). The SideShot Vent System is designed to accept all brands of 6” single wall, Type “B”, Class “A” or Type “L” vent pipe. The vent pipe used must be in compliance with local codes and the listing of the vent pipe manufacturer. When necessary, install tapered reducers and increasers as shown below.

Determine which inlet of the SideShot Vent System will allow for the least amount of elbows to the appliance. DO NOT USE BOTH INLETS. Calculate the equivalent vent pipe footage from the appliance to the SideShot Vent System by adding the straight vent pipe length and the equivalent elbow lengths together. Each 90 degree elbow is equal to 10 feet of straight vent pipe, each 45 degree elbow is equal to 5 feet of straight pipe. The equivalent vent pipe length must not exceed 50 feet from the appliance to the SideShot Vent System. Vent runs of over 15 linear feet should use an approved, insulated vent connector to prevent problems related to sulfur condensation. It is not necessary to maintain a 1/4” rise per every foot of horizontal when Side Wall Venting.

The SideShot Vent System is shipped from the factory with the plug connected to the rear and the vent pipe inlet collar connected to the bottom. If using the bottom inlet, skip to the section entitled “Vent Pipe Clamp Assembly”. If your installation requires the use of the rear inlet, follow the steps in the section entitled “Vent Pipe Inlet Collar Conversion” to move the vent pipe inlet collar from the bottom to the rear.

VENT PIPE INLET COLLAR CONVERSION

1. Remove the plug from rear inlet port by unfastening the 6 nuts that secure it to the Plenum. Keep the plug & nuts for later use, (See Diagram M).

2. Remove the sensing tube from the Fan Proving Switch by loosening the plastic compression fitting.

3. Remove the vent pipe inlet collar from the bottom port by unfastening the 6 nuts. Keep the nuts for later use.
4. Using a tube cutter, cut the sensing tube 2” from the elbow directed at the vent pipe inlet collar. (See Diagram L). Discard the cut off section of metal tube.

5. Attach the vent pipe inlet collar to the rear inlet port making sure that the sensing tube is orientated as shown. (See Diagram M). **NOTE:** Alignment marks on the inlet collar and plenum casing must match.

6. Attach 90° compression fitting to the short tube on the inlet collar.

7. Using the "soft" aluminum tubing, connect the Fan Proving Switch to the inlet collar. Take care not to crimp the tubing.

8. Install the plug removed in step 1 over the bottom inlet port, tightening securely.

**VENT PIPE CLAMP ASSEMBLY**

1. Attach the three vent pipe clamps to the inlet collar. (See Diagram N).  
   **NOTE:** The following diagrams show the use of the rear inlet. The same steps will apply if using the bottom inlet.

2. Bend each vent pipe clamp so it conforms to the outside diameter of the vent pipe being used. (See Diagram O).

3. Route the adjustable clamp through the openings at the opposite end of the legs.

4. Slide the vent pipe over the inlet collar of the SideShot.

5. Tighten the adjustable clamp around the vent pipe. (See Diagram O).
All wiring from the SS1 to the appliance must be appropriate Class 1 wiring as follows: installed in rigid metal conduit, intermediate metal conduit, rigid non-metallic conduit, electrical metallic tubing, Type MI Cable, Type MC Cable, or be otherwise suitably protected from physical damage.

SS1 SEQUENCE OF OPERATION WITH INTEGRAL UC1 UNIVERSAL CONTROL:

Control signal from thermostat, aquastat, primary control or gas valve is intercepted and routed to terminal “1” on UC1 terminal strip. When terminal “1” is energized with either 24 VAC or 120 VAC, the SS1 motor is energized. After draft is established, the Fan Proving Switch closes within 5 to 10 seconds energizing terminal “4”, which completes the circuit allowing burner to fire.

NOTE: If a venter pre-purge is selected, the burner will not fire until the pre-purge time is finished. The SS1 will continue to run after the burner has finished firing for the set post-purge time cycle. The SS1 is set for a 2 minute post-purge time period from the factory. See “Pre / Post-Purge Settings” on page 5 for details.

The "1" input terminal on the SideShot can accept either a 24 VAC or 120 VAC control signal. IMPORTANT: The RED jumper must be positioned based on appliance interlock voltage. For most furnace applications it may be easier to interlock with the 24 VAC thermostat circuit. For most boiler applications it may be easiest to interlock with the 120 VAC aquastat or primary control circuit to the burner motor. Choose the interlock method that best fits your application.

The steps listed under each diagram are intended as a supplement to the diagram. Wiring colors or designations may vary by manufacturer. If you are unable to wire the SS1 as outlined in these instructions, call Tjernlund’s Customer Service Department toll free at 1-800-255-4208 for assistance.

IMPORTANT: To reset faults, verify fault by checking the LEDs and then remove call for heat.

SS1 WITH INTEGRAL UC1 UNIVERSAL CONTROL
(THE SS1 MOTOR, LIMIT & PROVER ARE ALL FACTORY PREWIRED)

WARNING: Disconnect power supply from the SS1 and heating equipment when making wiring connections and servicing the SS1. Failure to do so may result in personal injury and/or equipment damage. LED #5 (RED) should be off with power removed.
1. Separate the Black burner motor wire from the Orange wire of R8184 Primary Control.
   NOTE: Do not separate the ignition transformer wire from the Orange.
2. Connect Orange wire of R8184 to #1 on UC1 terminal block.
3. Connect #2 on UC1 terminal block to White on R8184.
4. Connect Black of burner motor to #4 on UC1 terminal block.
5. Connect 115 VAC supply voltage to L & N terminals on UC1. Installer must supply overload and disconnect protection.
6. Crimp ground wire to grounding spade in SS1 electrical box.
7. Make sure RED voltage jumper on UC1 is on 115V.

1. Disconnect burner motor wire off the R7184.
2. Connect burner motor terminal of R7184 to #1 on UC1 terminal block.
3. Connect #2 on UC1 terminal block to L2 or N.
4. Connect #4 on UC1 terminal block to burner motor wire removed from R7184.
5. Connect 115 VAC supply voltage to L & N terminals on UC1. Installer must supply overload and disconnect protection.
6. Crimp ground wire to grounding spade in SS1 electrical box.
7. Make sure RED voltage jumper on UC1 is on 115V.
1. Disconnect B1 from L1 of oil burner primary control, burner relay or hot of gas valve and reconnect to #1 on UC1 terminal block.
2. Connect #2 on UC1 terminal block to B2 or N.
3. Connect #4 on UC1 terminal block to the L1 on line voltage oil burner primary control, burner relay or gas valve.
4. Connect 115 VAC supply voltage to L & N terminals on UC1. Installer must supply overload and disconnect protection.
5. Crimp ground wire to grounding spade in SS1 electrical box.
6. Make sure RED voltage jumper on UC1 is on 115V.

NOTE: If burner primary control goes out on lockout, the SideShot will continue to run as long as a call for heat is present.

1. Disconnect burner motor wire off the Orange on Carlin.
2. Connect burner motor terminal Orange of Carlin to #1 on UC1 terminal block.
3. Connect #2 on UC1 terminal block to L2 or N.
4. Connect #4 on UC1 terminal block to burner motor wire removed from Orange of Carlin.
5. Connect 115 VAC supply voltage to L & N terminals on UC1. Installer must supply overload and disconnect protection.
6. Crimp ground wire to grounding spade in SS1 electrical box.
7. Make sure RED voltage jumper on UC1 is on 115V.
SIDESHOT WITH INTEGRAL UC1 UNIVERSAL CONTROL CONNECTED WITH A HONEYWELL R8184 SERIES OR EQUIVALENT PRIMARY CONTROL AND A BURNER MOTOR POST-PURGE

1. Separate the burner motor wire and ignition transformer from the Orange wire of R8184.
2. Connect the Orange of R8184 to #1 on UC1 terminal block.
3. Connect #2 on UC1 terminal block to White on R8184 or N.
4. Connect the HOT wire of oil solenoid valve to #4 on UC1 terminal block and neutral wire to White or N.
5. Connect burner motor and ignition transformer HOT wires to M terminal on UC1 and neutrals to White or N.
6. Connect 115 VAC supply voltage to L & N terminals on UC1. Installer must supply overload and disconnect protection.
7. Crimp ground wire to grounding spade in SS1 electrical box.
8. Make sure RED voltage jumper on UC1 is on 115V.

SIDESHOT WITH INTEGRAL UC1 UNIVERSAL CONTROL CONNECTED WITH A SINGLE ZONE 24 VAC THERMOSTAT

1. Connect W from t-stat to #1 on terminal block of UC1.
2. Connect #2 on UC1 terminal block to C on internal control terminal strip of furnace/boiler.
3. Connect #4 on UC1 terminal block to W on internal control terminal strip of furnace/boiler.
4. Connect 115 VAC supply voltage to L & N terminals on UC1. Installer must supply overload and disconnect protection.
5. Crimp ground wire to grounding spade in SS1 electrical box.
6. Make sure RED voltage jumper on UC1 is on 24V.
1. Remove the wire on MV at gas valve and connect it on #1 on UC1 terminal block.
2. Connect #2 on UC1 terminal block to MV/PV.
3. Connect #4 on UC1 terminal block to MV on gas valve.
4. Connect 115 VAC supply voltage to L & N terminals on UC1. Installer must supply overload and disconnect protection.
5. Crimp ground wire to grounding spade in SS1 electrical box.
6. Make sure RED voltage jumper on UC1 is on 24V.

**SIDESHOT WITH INTEGRAL UC1 UNIVERSAL CONTROL CONNECTED WITH A 24 OR 115 VAC STANDING PILOT**

1. Remove the wire on TH or HOT of gas valve and connect it on #1 on UC1 terminal block.
2. Connect #2 on UC1 terminal block to TR or Common.
3. Connect #4 on UC1 terminal block to TH or HOT on gas valve.
4. Connect 115 VAC supply voltage to L & N terminals on UC1. Installer must supply overload and disconnect protection.
5. Crimp ground wire to grounding spade in SS1 electrical box.
6. Make sure RED voltage jumper on UC1 is on 24V or 115V depending on control voltage.
The SideShot Vent system will properly vent a wide range of BTU/hr. input capacities. To compensate for different burner capacities, vent connector lengths and wind conditions it features a draft adjustment located on the outside of the Vent Hood. In general, positioning the draft adjustment inward will cause the SideShot to operate at lowest capacity. Positioning the draft adjustment outward will cause the SideShot to operate at highest capacity.

**IMPORTANT:**

The following paragraph describes the initial draft adjustment. It may be necessary to make a slight readjustment to compensate for various conditions: wind, vent connector resistance, negative building pressure and multiple appliances.

ASHRAE lists the average design factor for wind loads in North America at 15 MPH. Refer to the Draft Adjustment Chart above. We recommend that the 25 MPH category be used to allow for excursions beyond the 15 MPH average. It is not recommended for the SideShot to be terminated on a wall that faces the direction of the prevailing winds. Backdrafts by severe winds can cause oil odors to remain in the structure and/or interrupt heating equipment operation. If the SideShot is terminated in a direction prone to higher winds, or if higher winds are common in your geographic area, use the 40 MPH category to determine the proper draft adjustment setting. If the draft adjustment is set at the 25 MPH category and sustained winds exceeding 25 MPH are present, the Fan Proving Switch will disrupt the burner until the wind load drops below 25 MPH. Wind loads referenced are based on straight line winds directed against the Vent Hood.

**IMPORTANT:**

Before proceeding, close all windows, doors and fireplace dampers. Turn on all appliances in the structure that exhaust indoor air such as clothes dryer, exhaust fans, range hoods, bathroom and whole house exhaust fans. Failure to perform the draft adjustment procedure may cause a poor vent system installation possibly resulting in fire, carbon monoxide poisoning, explosion, personal injury or property damage.

1. Set the draft adjustment on SS1 Vent Hood to the appropriate setting based on the above instructions and the Draft Adjustment Chart. Adjustment is accomplished by loosening both nuts on each side of the Vent Hood and centering both indicators to the desired setting. Tighten the four nuts to secure the draft adjustment at desired setting.

2. Insert a stack thermometer into the vent pipe as close as possible to the SS1 inlet. **NOTE:** plug hole when finished with installation.

3. Adjust barometric draft control to the minimum or least draft setting.

4. Place the heating system into operation. **NOTE:** There will be a slight pause between the venter operation and the burner operation.

5. Continuously monitor the over fire draft and adjust the barometric damper to maintain a reading of -.02 to -.03" W.C..

When the flue gas temperature at the venter inlet has stabilized make any final draft adjustment necessary to maintain a

**NOTES:** All draft adjustments are approximate. This chart is to be used for initial draft adjustment only. Subsequent draft adjustments may be required to compensate for various field conditions: wind, vent pipe resistance, building pressure, multiple appliances, etc.

BTU/HR input ratings assume 30% or less excess air for flame retention burners and 50% to 100% excess air for conventional oil burners.

**WARNING**

Do not exceed the recommended BTU/HR input range of the SideShot.

Under no circumstances shall the minimum draft adjustment be used for the larger input range of this product.

Improper draft adjustment may result in the dispersion of flue products/carbon monoxide into the building interior.
3. B. The main burner is burning properly, i.e. no floating, lifting or flash back.

2. Place the heating system into operation.

The SideShot Vent System will properly vent a wide range of BTU/hr. input capacities. To compensate for different burner capacities, vent connector lengths and wind conditions it features a draft adjustment located on the outside of the Vent Hood. In general, positioning the draft adjustment inward will cause the SideShot to operate at lowest capacity. Positioning the draft adjustment outward will cause the SideShot to operate at highest capacity.

IMPORTANT:

The following paragraph describes the initial draft adjustment. It may be necessary to make a slight readjustment to compensate for various conditions: wind, vent connector resistance, negative building pressure and multiple appliances.

ASHRAE lists the average design factor for wind loads in North America at 15 MPH. Refer to the Draft Adjustment Chart on Page 17. We recommend that the 25 MPH category be used to allow for excursions beyond the 15 MPH average. It is not recommended for the SideShot to be terminated on a wall that faces the direction of the prevailing winds. Backdrafts by severe winds can interrupt heating equipment operation. If the SideShot is terminated in a direction prone to higher winds, or if higher winds are common in your geographic area, use the 40 MPH category to determine the proper draft adjustment setting. If the draft adjustment is set at the 25 MPH category and sustained winds exceeding 25 MPH are present, the Fan Proving Switch will disrupt the burner until the wind load drops below 25 MPH. Wind loads are based on straight line winds directed against the Vent Hood.

IMPORTANT:

Before proceeding, close all windows, doors and fireplace dampers. Turn on all appliances in the structure that exhaust indoor air such as clothes dryer, exhaust fans, range hoods, bathroom and whole house exhaust fans. Failure to perform the draft adjustment procedure may cause a poor vent system installation possibly resulting in fire, carbon monoxide poisoning, explosion, personal injury or property damage.

DRAFT ADJUSTMENT PROCEDURE FOR GAS EQUIPMENT

The SideShot Vent System will properly vent a wide range of BTU/hr. input capacities. To compensate for different burner capacities, vent connector lengths and wind conditions it features a draft adjustment located on the outside of the Vent Hood. In general, positioning the draft adjustment inward will cause the SideShot to operate at lowest capacity. Positioning the draft adjustment outward will cause the SideShot to operate at highest capacity.

IMPORTANT:

The following paragraph describes the initial draft adjustment. It may be necessary to make a slight readjustment to compensate for various conditions: wind, vent connector resistance, negative building pressure and multiple appliances.

ASHRAE lists the average design factor for wind loads in North America at 15 MPH. Refer to the Draft Adjustment Chart on Page 17. We recommend that the 25 MPH category be used to allow for excursions beyond the 15 MPH average. It is not recommended for the SideShot to be terminated on a wall that faces the direction of the prevailing winds. Backdrafts by severe winds can interrupt heating equipment operation. If the SideShot is terminated in a direction prone to higher winds, or if higher winds are common in your geographic area, use the 40 MPH category to determine the proper draft adjustment setting. If the draft adjustment is set at the 25 MPH category and sustained winds exceeding 25 MPH are present, the Fan Proving Switch will disrupt the burner until the wind load drops below 25 MPH. Wind loads are based on straight line winds directed against the Vent Hood.

IMPORTANT:

Before proceeding, close all windows, doors and fireplace dampers. Turn on all appliances in the structure that exhaust indoor air such as clothes dryer, exhaust fans, range hoods, bathroom and whole house exhaust fans. Failure to perform the draft adjustment procedure may cause a poor vent system installation possibly resulting in fire, carbon monoxide poisoning, explosion, personal injury or property damage.

DRAFT ADJUSTMENT PROCEDURE

1. Set the draft adjustment on SS1 Vent Hood to the appropriate setting based on the above instructions and the Draft Adjustment Chart. Adjustment is accomplished by loosening both nuts on each side of the Vent Hood and centering both indicators to the desired setting. Tighten the four nuts to secure the draft adjustment at desired setting.

2. Place the heating system into operation. NOTE: there will be a slight pause between venter operation and burner operation. A Venter pre-purge of up to a minute may also be selected. See “Pre / Post-Purge Settings” on page 5. If installation uses a barometric draft control adjust it to the minimum or least draft setting. Allow heater to operate for 5 minutes.

3. PREFERRED METHOD: MUST HAVE DRAFT GAUGE AVAILABLE

Sample draft one foot after draft hood, diverter or barometric draft control using a draft gauge. If the draft reading is in excess of -0.05” W.C. adjust SS1 Vent Hood cone in (less draft) or adjust barometric for (less draft) so that a draft reading of -0.02” to -0.05” W.C. is obtained. Never adjust draft to a setting of less than -0.02” W.C. If the vent system is terminated on a wall subject to prevailing winds a -0.05” W.C. draft setting is recommended.

4. If a draft gauge is not available test for spillage at the draft hood, diverter or barometric draft control using the flame from a match, lighter or candle and determine the following:

A. The flame or smoke is being drawn into the draft hood, diverter or barometric draft control.

B. The main burner is burning properly, i.e. no floating, lifting or flash back.
C. If the heater has a two stage or modulating gas valve verify that burner operates properly at both low and high fire.
   If the draft appears excessive adjust SS1 Vent Hood cone in (less draft) or adjust barometric for (less draft) repeat steps A
   through C.

5. Lock down the he SS1 draft adjustment with four lock nuts on adjustment cone brackets and barometric damper adjustment knob
   if a barometric is installed, (See Diagram P).

6. Turn off appliances and exhaust fans activated for draft adjustment procedure.

**COMBUSTION AIR**

Adequate combustion air is vital for proper combustion and for safe venting. Likewise, for proper SS1 performance, adequate
combustion air must be available to the appliance. Many installers assume adequate combustion air is present, especially in older
homes. In some cases this is a false assumption, because many older homes have been made "tight" due to weatherization. Size
the combustion air opening(s) into the appliance room as outlined NFPA 54/NFPA 211. When installing a SS1, it is not necessary
to supply any more combustion air than normally required when conventional venting. Common symptoms of inadequate combus-
tion air include: Fan Proving Switch short cycling, odor present at the end of burner cycle, outside air enters the structure through
the SS1 Vent System on SS1/Appliance off cycle.

**FINAL SYSTEM OPERATION CHECK-OUT**

1. Adjust thermostat or appliance controls to call for heat.
2. Verify that the SS1 operates first, prior to burner ignition.
   Allow heating equipment and SS1 to operate continuously while performing steps 3-5.
3. Close all doors and windows of the building. If heating equipment is installed in utility room or closet, close the entrance door to
   this room. Close fireplace dampers.
4. Turn on all appliances in the structure that exhaust indoor air during their operation, e.g. turn on clothes dryer and exhaust fans
   such as range hoods, bathroom exhaust and whole house fans.
5. Allow SS1 and equipment to operate for at least 15 minutes. Tripping of the burner circuit by the Fan Prover Switch or High
   Limit during the 15 minute operation indicates an unsafe operating condition. Turn fuel supply off to appliance and DO NOT
   OPERATE UNTIL UNSAFE VENTING CONDITION IS INVESTIGATED BY QUALIFIED SERVICE PERSONNEL.
6. Turn thermostat or equipment controls to the "off" position. Verify that the venter operates for the post-purge time period set
   after the burner stops firing. See "Pre / Post-Purge Settings" on page 5.
7. Return all windows, doors and exhaust fans to their original conditions of use.

**TROUBLESHOOTING OIL ODORS**

Many problems can be eliminated quite easily by having the equipment properly set up by a professional oil-heat service contrac-
tor. The sophistication of today’s heating equipment and instrumentation needed for efficient operation requires proper training.
There is no substitute for the work of a qualified oil-heat service professional. All trouble shooting recommendations that follow
assumes the equipment is installed and maintained by a qualified service person.

**Post-purge:** A post-purge is always necessary on oil installations. The factory default post-purge time period is 2 minutes. Just
as a chimney continues to draft after the burner has shut-down, the SS1 will continue to run to clear the vent system of residual
gases. The duration of the post-purge cycle is adjustable from 0 to 16 minutes. We recommend a minimum of 2 minutes post-
purge on oil.

**Draft Adjustment:** The SideShot Draft Adjustment, located outdoors on the Vent Hood, has two functions: A) It allows the installer
to fine-tune the amount of draft that the SideShot must develop to vent the specific appliance, and B) It prevents air infiltration
caused by strong winds and gusts. Air infiltration back through the vent system will bring with it the odors from the flue gas residue
on the inside of the vent pipe. When the Draft Adjustment is at an inward setting (lower number) the Vent Hood will deflect a
greater volume of wind than at a higher setting.

**IMPORTANT**

Any adjustment to the draft setting must be followed by an over-fire draft measurement and necessary adjustments to the
primary air intake on the burner and barometric draft control. See “Draft Adjustment Procedure”, page 17.

**Burner Adjustment:** Verify that the over-fire draft matches that recommended by the heating equipment manufacturer. Adjust the
combustion efficiency and smoke characteristics to optimum levels of performance.
Combustion Air: Modern construction methods and materials have reduced natural air infiltration rates to extremely low levels. Even older homes can lack adequate air for combustion, when insulation upgrades and other weatherization methods have been installed. It is recommended that fuel burning appliances have dedicated sources of outside air for combustion. This may be simply accomplished by running a properly sized duct from outdoors and terminating it near the burner air intake. Accessory air intakes are available that connect to the burner motor, using it to pull in the outdoor air. The Tjernlund IN-FORCER™ Combustion Air Intake tempers the raw outdoor air as it is delivered to the burner. Without a source of outdoor air for combustion, a tight home's negative pressures will draw odors back through the venting system during the appliance off cycle.

Chronic Oil Odor Conditions: Certain features of the specific appliance and installation, e.g. high heat-retention combustion chamber; low-mass, dry-base; piping system design; oil impurities; air in lines, can all contribute to an increased production of oil odor and cannot always be anticipated. For extreme cases of oil odor nuisance Tjernlund recommends the practice of post-purging the burner during the vent system post-purge. A burner post-purge cycle can eliminate any shortcomings of compatibility between the specific installation and the SideShot. Burner post-purge kits, such as, Tjernlund’s P/N 950-2043, are available from most oil equipment distributors. Burner post-purge kits should be used on installations where the combustion air is being adequately supplied, yet oil odors continue.

TROUBLESHOOTING ELECTRICAL PROBLEMS

⚠️ WARNING
The following guide is intended to be used if a problem occurs during the use of the SS1 side wall vent system. It may be necessary to measure voltage during troubleshooting.

Extreme caution must be exercised to prevent injury. If you are unable to determine the defective part with the use of this guide, call your Tjernlund distributor or Tjernlund Products direct at 1-800-255-4208 for further assistance.

IMPORTANT: To reset faults, verify fault by checking the LEDs and then remove call for heat.

LED STATUS & FAULT INDICATORS

LED INDICATOR LIGHTS
LED #1 (Amber) Appliance call for heat.
LED #2 (Green) Safety circuit through P1 & P2 (SS1 Limit & Fan Prover) is verified “Open” upon start-up. Burner circuit is energized with contact closure from terminal 3 to 4. Also verifies SS1 prover & limit are closed during run cycle.
LED #3 (Green) Power switched to SS1 Motor from L to MTR & M.
LED #4 (Red) Status indicator.
LED #5 (Red) 115 VAC power supplied to board. Also used as status indicator.

LED INDICATOR LIGHT STATUS & FAULTS
LED #4 & #5 Flashing Alternately = Prover start up fault. SS1 Prover contacts “Closed” across P1 & P2 upon appliance call before SS1 is turned on. Prover status check must be activated, see page 5.
LED #4 & #5 Flashing in Unison = Fan Prover circuit is “Open” longer than 60 seconds on start-up or 10 seconds during run cycle. Prover or Limit contacts are not staying “Closed” across P1 & P2 safety circuit.
LED #4 Flashing & #5 on Continuous = System in Pre-Purge. (Pre-Purge options 0, 15, 30, 60 seconds)
LED #5 Flashing & #4 on Continuous = System in Post-Purge. (Post-Purge options 0, 30 seconds or 1, 2, 4, 8, 16 minutes)

SYMPTOM 1: SS1 OPERATES CONTINUOUSLY
Verify that Venter is not in post-purge mode which could last up to 16 minutes. A factory post-purge has been set for 2 minutes. LED #4 (Red) will be on continuously and LED #5 will be flashing during post-purge. A Venter pre-purge could also be set for up to 1 minute. LED #4 (Red) will be flashing and LED #5 will be on continuously during a Venter pre-purge. See “Pre / Post-Purge Settings” on page 5.

Verify that LED #1 (Amber) is not lit.

Yes, LED #1 (Amber) is lit: Check interlock wiring. UC1 control is receiving constant call for heat signal.

LED #1 (Amber) is not lit: Replace UC1 circuit board part number 950-8801.

SYMPTOM 2: SS1 MOTOR DOES NOT OPERATE
Verify that UC1 control has power, LED #5 (Red) should be lit.

No: Check circuit breaker, disconnect switches and wiring.

Yes, LED #5 (Red) is lit: Verify that the interlocked burner is calling for heat, LED #1 (Amber) should be lit.

No, LED #1 (Amber) is not lit: Verify interlock wiring and that thermostat/aquastat is adjusted to call for heat. Verify that the RED voltage selection jumper is installed so that it matches the voltage of the interlocked burner.
Yes, LED #1 (Amber) is lit: Verify Prover safety circuit fault does not exist. See LED indicator light status & faults, on page 20.

If faults exist check Prover P1 & P2 safety circuit.

If no faults exist, check for 115 VAC across terminals N and MTR.

Voltage present: Replace SS1 motor part number 950-0625.

No voltage present: Replace UC1 circuit board part number 950-8801.

**SYMPTOM 3: SS1 OPERATES, BUT BURNER DOES NOT**

NOTE: Prover status check **must** be activated, see page 5. For any newly established call for heat the SS1 will run for 60 seconds to try to close the fan prover circuit (P1 to P2). If circuit cannot be made after 60 seconds LED’s 4 & 5 (Red) will flash in unison, indicating a prover check circuit fault on SS1 start up. The SS1 will shut down and LED’s 4 & 5 (Red) will flash in unison, indicating a prover check circuit fault on SS1 start up. NOTE: If primary control of oil burner locks out during the 1 minute period the UC1 safety circuit and LED’s 4 & 5 will be reset. If the fan prover makes on start up, but breaks for more than 10 seconds during the burner cycle, LED’s 4 & 5 (Red) will flash in unison indicating a prover circuit fault. The SS1 will continue to run for 10 minutes to try to make the prover circuit as long as a call for heat exists. After 10 minutes the SS1 will shut down and LED’s 4 & 5 (Red) will flash in unison indicating a prover circuit fault. Remove the call for heat and then reestablish to reset the UC1 prover safety circuit (P1 to P2) & LED’s.

Verify that LED #2 (Green) is lit.

Yes, LED #2 (Green) is lit: Verify that “call jumper” is connected from J1 to J2 on UC1 circuit board. With call for heat established, verify that wiring is correct by measuring voltage between terminals 1 & 2 and 2 & 4 of UC1 terminal strip. Voltage should be the same in both cases, if not rewire per appropriate diagram. NOTE: If using the “Dry Contact” interlock method, make sure that the RED voltage selection jumper is installed on the dry contact tabs.

No, LED #2 (Green) is not lit: Remove call for heat and reestablish a call for heat to reset control. Within 1 minute of call for heat, carefully jump a wire between P1 & P2 on UC1 control. LED #2 (Green) should light.

No, LED #2 (Green) does not light: Replace UC1 circuit board, part number 950-8801.

Yes, LED #2 (Green) lights up: Remove supply power to UC1. Remove Jumper from P1 & P2. The SS1 high limit is open, the fan proving switch is not closing, or wiring connections are incorrect/broken. Disrupt call for heat. Push reset button on SS1 high limit box. NOTE: Insufficient post-purge may cause limit to trip. If the limit switch trips, verify that the post-purge setting is long enough to remove residual heat from the combustion chamber. If high limit trips repeatedly, do not operate the heater until the source of excessive heat has been determined and repaired. If high limit will not reset and has an open circuit, replace high limit part number 950-0640.

Initiate call for heat. With SS1 running, verify that venter performance is sufficient to close fan prover. Draft gauge should read a minimum of -0.05” w.c. at SS1 Prover sampling port.

No, measured draft is less than -0.05” w.c.: Verify that SS1 vent hood draft adjustment is at proper setting, see “Draft Adjustment Procedure”, page 17. Visually inspect system for blockages. Confirm that maximum BTU/hr. input and vent pipe lengths are not exceeded. See “Application Table” on page 1 for capacities. Check fan proving switch sensing tube for blockage.

Yes, measured draft is at least -0.05” w.c.: Replace fan proving switch part number 950-0650.

### MAINTENANCE

#### SERVICE TECHNICIAN AND USER REQUIREMENTS

1. SS1 must be visually inspected annually.

2. On oil, verify over-fire draft, CO₂ and smoke readings are all correct. See “Draft Adjustment Procedure” on page 16.

3. Annually inspect vent pipe for evidence of corrosion. If any corrosion is found replace vent pipe and inspect venter.

4. The SideShot blower wheel **must** be inspected annually. Particulates, such as soot, oil impurities and sheet rock dust, can prevent proper venting and will cause noise and vibration. Follow instructions, on page 22 for motor/wheel assembly removal.

5. Clean all particulate from wheel with a soft metal wire brush and soot cleaner. Clean the pocket of each blade, as well as the rest of the wheel.

6. A wheel that exhibits large amounts of particulate or appears to be out of round should be replaced with a new wheel. Instructions for wheel replacement are listed on page 22.
REMOVAL AND REPLACEMENT OF MOTOR/WHEEL ASSEMBLY (DIAGRAM N)

⚠️ WARNING

Disconnect power supply from the SS1 and heating equipment when making wiring connections and servicing the SS1. Failure to do so may result in personal injury and/or equipment damage. LED #5 (RED) should be off with power removed.

1. Remove electrical box cover.
2. Disconnect the two motor leads from the MTR & N terminals.
3. Remove motor bracket screw from electrical box.
4. Holding the motor, apply firm pressure towards the plenum of the SideShot and remove the six motor mount nuts. **Note: Hold the assembly firmly; failure to do so could damage internal parts.**
5. Slide motor/wheel assembly from Plenum. Grasp only the motor casing; do not damage wheel, shaft or other components on Plenum. Do not rest assembly on wheel.

WHEEL REPLACEMENT (DIAGRAM N)

1. Loosen set screw from wheel hub by using a 5/32” allen wrench.
2. Twist wheel to loosen and pull off of motor shaft. **Do not pull too hard; wheel may bend.** Wheels “fused” to shaft may require penetrating oil and/or a wheel puller to facilitate removal.
3. Slide new wheel on to flat of shaft and firmly tighten set screw.

MOTOR OILING

The SideShot motor is permanently lubricated and requires no oiling.

HOW TO OBTAIN SERVICE ASSISTANCE

1. If you have any questions about your Power Venter or if it requires adjustment, repair or routine maintenance, we suggest that you contact your installer, contractor or service agency.
2. If you require technical information contact Tjernlund Products, Inc. at 1-800-255-4208.

When contacting Tjernlund Products, Inc., please have the following information available:

1. Model of the Power Venter as shown on the label attached to Power Venter.
2. Name and address of installer and any service agency who performed work on Power Venter.
3. Date of original installation and dates any service work was performed.
4. Details of the problem as you can best describe them.
LIMITED PARTS WARRANTY AND CLAIM PROCEDURE

Tjernlund Products, Inc. warrants the components of the SideShot for two years from date of installation. This warranty covers defects in material and workmanship. This warranty does not cover normal maintenance, transportation or installation charges for replacement parts or any other service calls or repairs. This warranty DOES NOT cover the complete SS1 if it is operative, except for the defective part.

Tjernlund Products, Inc. will issue credit or provide a free part to replace one that becomes defective during the two year warranty period. Proof of date of the installation in the form of the contractor sales/installation receipt is necessary to prove the unit has been in service for under two years. All receipts should include the date code of the SideShot to ensure that the defective component corresponds with the complete unit. This will help preclude possible credit refusal.

1.) Follow troubleshooting guide to determine defective component. If unable to determine faulty component, contact your Tjernlund distributor or Tjernlund Products Technical Customer Service Department at 1-800-255-4208 for troubleshooting assistance.

2.) After the faulty component is determined, return it to your Tjernlund distributor for replacement. Please include SideShot date code component was taken from. The date code is located on the Electrical Box coverplate. If the date code is older than 2 years, you will need to provide a copy of the original installation receipt to your distributor. Credit or replacement will only be issued to a Tjernlund distributor after the defective part has been returned prepaid to Tjernlund.

WHAT IS NOT COVERED

Product installed contrary to our installation instructions
Product that has been altered, neglected or misused
Product that has been wired incorrectly
Product that has been damaged by a malfunctioning or mistuned burner
Any freight charges related to the return of the defective part
Any labor charges related to evaluating and replacing the defective part

TJERNLUND LIMITED TWO YEAR WARRANTY

Tjernlund Products, Inc. warrants to the original purchaser of this product that the product will be free from defects due to faulty material or workmanship for a period of (2) years from the date of original purchase or delivery to the original purchaser, whichever is earlier. Remedies under this warranty are limited to repairing or replacing, at our option, any product which shall, within the above stated warranty period, be returned to Tjernlund Products, Inc. at the address listed below, postage prepaid. THERE ARE NO WARRANTIES WHICH EXTEND BEYOND THE DESCRIPTION ON THE FACE HEREOF, AND TJERNLUND PRODUCTS, INC. EXPRESSLY DISCLAIMS LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING FROM THE USE OF THIS PRODUCT. THIS WARRANTY IS IN LIEU OF ALL OTHER EXPRESS WARRANTIES AND NO AGENT IS AUTHORIZED TO ASSUME FOR US ANY LIABILITY ADDITIONAL TO THOSE SET FORTH IN THIS LIMITED WARRANTY. IMPLIED WARRANTIES ARE LIMITED TO THE STATED DURATION OF THIS LIMITED WARRANTY. Some states do not allow limitation on how long an implied warranty lasts, so that limitation may not apply to you. In addition, some states do not allow the exclusion or limitation of incidental or consequential damages, so that above limitation or exclusion may not apply to you. This warranty gives you specific legal rights and you may also have other rights which may vary from State to State. Send all inquiries regarding warranty work to Tjernlund Products, Inc. 1601 9th Street, White Bear Lake, MN 55110-6794. Phone (651) 426-2993 • (800) 255-4208 • Fax (651) 426-9547 • Email fanmail@tjfans.com.
(Cut on dashed line to remove template)

(For proper use of the template, see the SideShot Installation Instructions.)

- Refer to the NOTCH BRACING section of the instructions for information on bracing.
- Insure proper clearance to combustibles is followed. (1/2" min. on SideShot sides)

- Align this edge of the template with the bottom edge of the joist.
